**Let's Start!**

Organizing Tags in HTML Structures.

**Learning Outcome:**

Describe common activities at work using short sentences in familiar spoken and written situations.

Interpret the requirements report to determine the technological needs in managing information, based on rules and protocols established by the company.

Can Do Statements:

- I can explain the structure of HTML.
- I can describe with examples, how the tags are organized in the structure.

Ask your partner:

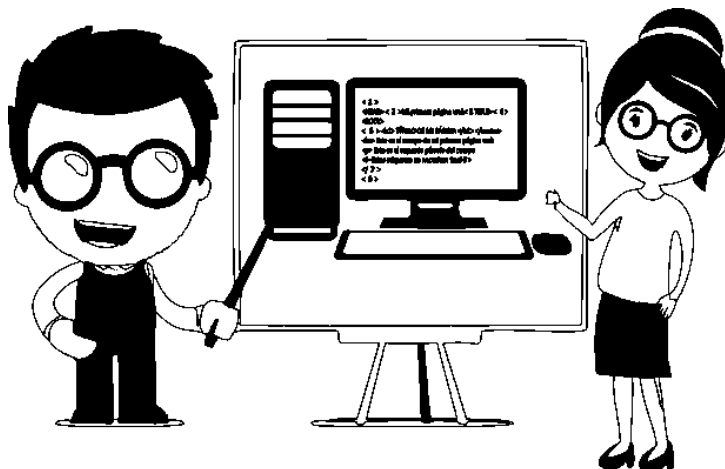

- What structure do you follow to create a document or an essay?
- How can you compare the structure of an essay with the structure of HTML?

Let's Explore!

Students' presentation about the structure of HTML.

Instructions: Read the text below.

Professor: I'm glad to hear your presentation about web pages. Are you ready?

Student 1: Yes, first, if you begin a new page, you have to include a declaration. This tells the browser that the following file is an HTML file.

Professor: I'm sorry to interrupt you but, can you explain how they are structured?

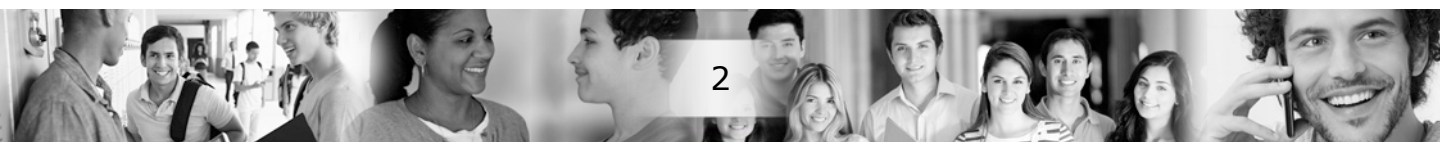

Student 2: Right, HTML has two main parts: the head and the body. If you build a new webpage, you need to consider these tags: `< html >`, `< head >`, `< title >` and `< body >` which are container tags. When you use container tags you need to have a beginning and an end.

Student 1: As you know, when you do a HTML document, you always have to begin and end the document with a tag. This is because they inform the browser how to display the information. Then, the `< head >` includes general information about the file, for example, the author, copyright and keywords.

Student 2: In the head part, you also find the title part. Titles have to be descriptive. So, make sure they don't have more than 20 words. Finally, the body: text images, links, and some other relevant information you want to include.

Student 1: Nesting is a very important part of the web structure. If you have a new set of tags, you need to nest them inside other tags. In this case, for example, the tag title, and head are nested and the body is nested inside HTML.

Professor: Now we are prepared to design a webpage.

Let's Practice!

Are you ready to talk about the rules and main parts of HTML?

Instructions: Read the sentences. Use: have to include, has to be, need to consider to correctly complete the sentences.

1. If you begin a new page, you _____ a declaration.
2. This tells the browser that the following file _____ an HTML file.
3. If you build a new webpage, you _____ the tags.

Let's Practice!

Always use tags in HTML documents.

Instructions: Proofread the sentences. Correct the mistakes.

1. When you do a HTML document you all ways have to begin and end the document with a <html> tag.
2. This are because they inform the browser how to display the information.
3. In this way the browser recognize that the following document is an html file.

Extension Activity

Explaining HTML structure.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Find out information about the structure of HTML.
- Create a mind map giving examples about how the tags are organized in the structure.
- Share your work with your classmates and check pronunciation with your instructor.

Self-Assessment

Yes

No

1. I explain the structure of HTML.

☐
☐

2. I describe with examples, how the tags are organized in the structure.

☐
☐

3. I use different grammar structures to give examples about how tags are organized.

☐
☐

Target Words

- **willing** (adjective): feeling enthusiastic
e.g. We're willing to learn everything about the structures of HTML.
- **declaration** (noun): an explicit statement of something
e.g. Well, first thing, if you begin a new page, you have to include a declaration.
- **copyright** (noun): the legal right that an author has for the creation of something
e.g. Then, the "< head >" includes general information about the file, for example, the author, copyright and keywords.
- **nesting** (verb): to fit one thing inside another.
e.g. Nesting is a very important part of the web structure.
- **structure** (verb): to organize something in a structure
e.g. I'm sorry to interrupt you but can you explain how they are structured.
- **comprehend** (verb): to include
e.g. Finally, the body comprehends the text images, links, and some other relevant information you want to include.

Learning Points

Adjectives + Infinitives.

You can use infinitive verbs after adjectives when you want to express feelings or how you react to things.

Remember that **infinitives** almost always begin with the word **to** and after them you write the simple form of the verb which is not conjugated. It means that for the infinitive verbs you don't have to add **s**, or **es**, **ed** or **ing** at the end. For example, *to eat*, *to play* and *to work*.

Adjectives are words that you use to describe things, people, animals, places. For example: *happy*, *big*, *small*, and *interesting*.

You can use an adjective and after an infinitive verb in a sentence, when you want to specify a feeling or a reaction to something.

Examples:

- *I am **happy to see** you.*
- *She was **afraid to meet** him.*

Examples

- *I'm glad to hear your presentation about web pages.*
- *So, are you ready to present the rules and main parts?*
- *I'm sorry to interrupt you but can you explain how they are structured.*

Learning Points

Zero Conditional to Talk About a Specific Topic, and Verbs Plus Infinitives in the Main Clause.

You use the zero conditional to talk about a situation that is real or to mention rules.

You use this structure to explain two situations that complement each other and that are always real. The first part explains a condition. The second explains the result, consequence or direct relation to the first condition. Both parts need to be in present simple.

After the main clause, you can use infinitives:

If (main clause) + Present Simple (infinitive)

Do not forget to keep the structure of infinitives.

Example:

- **If** you create a web page, you **have to use** tags.
- **If** you write codes, you **need to be** careful.

Examples

- So, if you build a new webpage, you need to consider these tags: `<html>`, `<head>`, `<title>` and `<body>`.
- If you begin a new page, you have to include a declaration.
