Let's Start!

Making Predictions About Programming.

Learning Outcome:

Describe common activities at work using short sentences in familiar spoken and written situations.

Interpret the requirements report to determine the technological needs in managing information, based on rules and protocols established by the company.

Can Do Statements:

- I can read about changes of software in the future.
- I can write a short paragraph to explain how software changes.
- I can explain why software changes.

Ask your partner:

- How do you think programming will be in 10 years?
- What factors do you consider will generate changes in software?

Let's Explore!

How will software be in the future?

Instructions: Read the text below.

Jacob: Hi, what are you reading?

Paul: I'm reading an article about software. It talks about the changes that software is having in the next years.

You know the world of tech moves so fast. So they are analyzing some trends to show projections for the future. It says that smartphones are going to do everything. At the moment, they're doing many things. People make transactions, they buy things, and they even study in their phones. But I'm sure there are going to be more advanced applications. For example, in the future, it's not going to be necessary for people to go to the doctor for medical assistance, because through different applications they can have a checkup.

Jacob: But how does software change?

Paul: Software has modifications every day. For instance, smartphones are products that can easily change in order to adapt to an environment. Some studies mention that software may change for a variety of reasons and there are important advantages for programmers and users when this happens. For example, they can add new features, also they can correct faults and they can restructure codes to accommodate future variations. So we have to learn how to do all those software modifications.

Jacob: Yes, that's absolutely true. If we want to continue working as programmers, we need to get used to everyday changes, right? I am presenting an article next month about the new educational needs due to those probable changes. I think all professors are wondering the same; if they just teach how to write software, we don't learn how to write real code. When you start programming, you realize how hard it is to juggle all of those numbers. It's difficult to create an entire system with millions of lines of code if you don't have the knowledge and tools to do it.

Let's Practice!

What does the future have for software?

Instructions: Cross out the incorrect word and write in the correct word.

1. Smartphones _____ more transactions. (are going to make / are going to go)
2. The internet _____ and now it works like TV because we can find any season of a TV series. (is change / is changing)
3. The new version of HTML _____ the opportunity to create websites. (give / is giving us)
4. She _____ the software as soon as she understands how to write real codes. (thinks / programs)
5. Cloud services _____ an impact on software development in the next few years. (are having / is to have)

Let's Practice!

Technology is constantly changing.

Instructions: Match the sentences from Column A with Column B.

COLUMN A

1. If the software changes,
2. if it suffers transformations.
3. If we modify technology constantly,
4. If society keeps changing and involving technology in every aspect of our lives,

COLUMN B

- a. Software can correct faults and restructure codes to accommodate to future variations.
- b. we add new features.
- c. software has to change too and adapt to our new society.
- d. software constantly changes too.

Extension Activity

Let's talk about software in the future...

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Read about changes of software in the past and in the future.
- Prepare a presentation to your classmates in order to explain how and why software has changed.
- Draw a comparative chart in which you describe and compare the changes that software has had and will have.
- Share your presentation with your classmates and check your pronunciation with your instructor.

Self-Assessment

Yes

No

- I read about changes of software in the past and in the future. ☐ Yes ☐ No
- I prepare a presentation to explain how software has changed and will change. ☐ Yes ☐ No
- I draw a comparative chart as a visual aid for my presentation. ☐ Yes ☐ No
- I share my presentation with my classmates and instructor. ☐ Yes ☐ No

Target Words

- **restructure** (verb): to change or modify something
e.g. features, also they can correct faults and they can restructure code to accommodate future variations.
- **juggle** (verb): to manipulate something
e.g. When you start programming, you realize how hard it is to juggle all of those numbers.
- **knowledge** (noun): information that a person has about something
e.g. It's difficult to create an entire system with millions of lines of code if you don't have the knowledge and tools to do it.
- **wonder** (verb): to ask yourself something
e.g. I think all professors are wondering the same.
- **environment** (noun): the atmosphere or the condition of a place or situation
e.g. Smartphones are products that can easily change in order to adapt to an environment.
- **projection** (noun): a view of the future
e.g. So they are analyzing some trends to show projections.

Learning Points

Zero Conditional Review.

You use the zero conditional to talk about real situations and facts.

You use this conditional to explain two situations that complement each other and that are always real. The **first part** explains a **condition**. The **second** explains the **result, consequence** or **direct relation** to the first condition.

Both parts need to be in present simple and they are always about true situations that are obvious, rules or general situations which always have the same result.

For zero conditional, this is the structure you use:

If / When + sentence in present simple tense (**condition**),
+ sentence in simple present (**result**).

For example:

If you **use** HTML, **you can design** a website.

Notice that the clauses are separated by a comma when the first clause is the condition.

Simple Present Tense, Present Continuous, and Be Going to Review to Talk About Future Trends in a Specific Topic.

In English, there are several ways to talk about the future. We can talk about the future using **present simple**, **present continuous** and **be going to**. Let's see how that works.

Simple present

Normally, you use **the present simple** to refer to routines, daily events, and things that usually happen or actions that you frequently do, but you can also talk about the future; you can use the present simple when you talk about something planned in advance:

Follow this structure to talk in present simple:

Subject + **verb in present** + complement.

Learning Points

Examples:

We **work** with HTML 5.0 until they release the new version.
Software creating **starts** next month.

Present continuous

You use **the present continuous** to say that an action is happening at the same moment of speaking or that an action is temporarily happening in the present. However, you can also use this tense to talk about plans in the future.

This structure is the one you follow to form the present continuous:

Subject + **be (are - is - am) + verb + ing** + complement.

Examples:

- We **are designing** the website for that company next month.
- They **are planning** on using our software on their next project.

Be going to

You use the structure **be going to** to talk about plans in the future. You can use going to when you are sure something happening because there is evidence or plans about it.

We use this structure to talk with **going to**:

Subject + **be (are-is-am) + going to + verb** + complement.

Examples:

- I'm **going to work** with requirement elicitation.
- They **are going to observe** the company to learn about our workflow.
