Let's Start!

The Basis to Create a Web Page.

Learning Outcome:

Describe common activities at work using short sentences in familiar spoken and written situations.
Interpret the requirements report to determine the technological needs in managing information, based on rules and protocols established by the company.

Can Do Statements:

- I can talk about HTML and the web.
- I can explain briefly how HTML works.
- I can give information related to HTML.

Ask your partner:

- What do you think is necessary to create a website?
- Why do you think HTML is so important to create webpages?

Let's Explore!

Ms. Lopez is teaching his students the importance of HTML in the web. Can you tell how important it is?

Instructions: Read the text below.

- Ms. Lopez:** In order to continue with the topic of how to create a website, we need to clarify some key concepts that will make our life easier at the moment of creating our webpages. I'm talking, of course, about HTML and the web. Who can tell me the relationship between those ones?
- Jeffery:** Well, Ms. Lopez, I might be wrong, but I think they must have a close relationship, as one works inside the other. I mean, HTML works inside the web, or world wide web, as a tool for displaying websites and webpages.
- Ms. Lopez:** Well done, Jeffery. You are right about that one, their main relation is that we use html inside the web for presenting the information we have in our websites. But, do you know how it works?
- Jeffery:** Well, that I don't know.
- Ms. Lopez:** Ok, as you all know, HTML is a hypertext markup language, that is, a special language we, as developers, use to tell the web browser how to display the information we have. However, such information has a hidden code that we write inside some tags. Thus, the main components you need to learn by hearth before writing code with html are: syntax, tags, and of course, the text editor.
- Jeffery:** Sorry, Ms. Lopez. Could you give us some examples of them?
- Ms. Lopez:** Of course; for example, the first one: when developing a webpage, you need to be good at writing code in html language, I mean, you need to manage the syntax of the language. Similarly, you have to know how to use the tags, as there are containers and empty tags. The first ones are for containing the whole code, and the empty ones are for giving specific instructions without code in them, example being the break one. Finally, you need to write the code inside the tags with the proper syntax in a text editor, that is, the Notepad in windows or TextEdit in MAC. Anyway, there are more versions of HTML, in fact, the latest one is HTML5, but before working with it, you need to learn the ropes by reading about HTML.

Let's Practice!

Do you know how to write code using HTML?

Instructions: Read the sentences. Type in the missing words. Use: after writing, for displaying, for presenting the.

1. HTML works inside the web, or world wide web, as a tool _____ websites and webpages.
2. We use html inside the web _____ information we have in our websites.
3. Only _____ the website in HTML, you upload it to the web so that people can see it.

Let's Practice!

How can we use HTML?

Instructions: Match the sentences from Column A with Column B.

COLUMN A

1. Empty tags represent a command by themselves,
2. You have to write HTML code within angle tags, the first one...
3. You need to write the HTML code on a text editor;

COLUMN B

- a. opens the string and the one with a forward slash closes the tag.
- b. as those ones open and close the command at same time.
- c. you can choose the one that comes preinstalled in your computer.

Extension Activity

It is time for you to prove how much you know about HTML.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Search for more information about HTML and HTML5.
- Take notes about their difference and their uses.
- Make a short composition where you state their differences and uses using the grammar you learnt during this lesson.
- Share your composition with your classmates and instructor.

Self-Assessment

Yes

No

- I do research about HTML and HTML5. ☐ ☐
- I take notes and make a short composition stating the differences and uses of HTML and HTML5 using gerunds after prepositions and the pronoun one and ones. ☐ ☐
- I share my composition with my classmates and instructors. ☐ ☐

Target Words

- **web** (noun): a big group or system of data and documents that are interconnected to the internet
e.g. HTML works inside the web, or world wide web, as a tool for displaying websites and webpages.
- **hypertext** (noun): text that has links to connect other texts on the web
e.g. Ok, as you all know, HTML is a hypertext markup language, that is, a special language we, as developers, use to tell the web browser how to display the information we have.
- **display** (verb): to show or present by means of a screen
e.g. HTML is a hypertext markup language, that is, a special language we, as developers, use to tell the web browser how to display the information we have.
- **tag** (noun): a sequence of characters grouped to transfer information to a computer
e.g. The main components you need to learn by heart before writing code with html are: syntax, tags, and of course, the text editor.
- **syntax** (noun): a group of symbols containing meaning in a language
e.g. you need to write the code inside the tags with the proper syntax in a text editor, that is, the Notepad in windows or TextEdit in MAC.

Learning Points

Preposition + Ing.

Every time you find a **preposition and a verb** or action together in a sentence, the verb must be a gerund, that is, the termination **-ing**.

First of all, you need to understand that prepositions are words that you use to indicate the relationships between different words in a sentence. For example, in, at, with, for, about, or of, among many others.

When a verb comes after a preposition, you need to add the termination -ing. It means that in a sentence if you have a preposition, the verb that goes after it takes the -ing form.

Take into consideration that the preposition "to" most of times represents the infinitive form of a verb rather than the preposition.

For example, the verb like does not have a preposition; therefore you can say:

*I **like to** use HTML instead of CSS.*

On the other hand, the verb **confess** always goes with the preposition to, that is, confess to.

*He **confessed to having** no idea about how HTML worked.*

Therefore, a common structure where you could find a preposition + gerund is as follows:

(Subject) + Main verb + Preposition + Action (gerund) + complement.

For example:

- **Before creating** a webpage, you need to learn basic concepts of HTML.
- She convinced me **of using** HTML5 instead of CSS to design the website for the company.

Examples

- We need to clarify some key concepts that will make our life easier at the moment of creating our webpages.
- HTML works inside the web, or world wide web, as a tool for displaying websites and webpages.
- We use html inside the web for displaying the information we have in our websites.
- You need to be good at writing code in html language.

Learning Points

The History of the World Wide Web and HTML.

The creation of the World Wide Web is often confused with the creation of the internet, but they are different. Let's check some historical data.

The World Wide Web (www) is a global network that works on the internet platform. The invention of the www dates back to 1980. However, a decade after the invention of the internet, Tim Berners-Lee, an independent worker at the European Organization for Nuclear Research, CERN, developed ENQUIRE (a database that was able to interact with the hypertext). With this new prototype, every new page they created had to be linked to an existing page.

In 1984, Berners-Lee returned to CERN and realized that around the world scientists needed to share information through their computers, but there was a limitation to make this to happen, as software and hardware were very different one another.

By 1989, he wrote a first proposal for the development of the www, but that generated little interest in the organization. Later that year, he worked with Robert Cailliau to develop the necessary tools for creating the www. Those tools were: the Hypertext Transfer Protocol (HTTP); the first browser, *WorldWideWeb*, that later changed to Nexus; the first application server; and the hypertext markup language (HTML). All of them allowed the development of web pages that used a unified language.

In 1991, Berners-Lee wrote 18 elements that included an earlier design of HTML.

By 1992, several scientific departments of universities and laboratories around the world adopted the www. The first websites showed consulting pages and updated lists. On the other hand, the first stable web browser appeared in 1993, Mosaic, and in 1994, Robert Cailliau organized the first international conference of the WWW at CERN. Since that moment on, many browsers started to appear, some of them are no longer there, like Netscape, but there are some other browsers that still there, such as E-explorer or Mozilla. Nowadays, web browsers not only support html, but CSS and many other languages such as Java, JavaScript, and more.
