Let's Start!

Things You Need to Know About HTML.

Learning Outcome:

Describe common activities at work using short sentences in familiar spoken and written situations.
Interpret the requirements report to determine the technological needs in managing information, based on rules and protocols established by the company.

Can Do Statements:

- I can talk about basic concepts on HTML.
- I can describe basic concepts and some rules about HTML.
- I can give examples related to tag / elements, container and empty tags.

Ask your partner:

- How do programmers usually create web pages?
- How important is to organize the content on a web page?

Let's Explore!

Amy teaches John the basics of HTML.

Instructions: Read the text below.

Amy: John, if you want to learn everything about HTML, I suggest reviewing some basic concepts and rules first.

John: Sure, what should I take into account?

Amy: First, you must write HTML in plain text and there is no need to use a fancy software to write codes.

John: Really? What can I use instead?

Amy: You can use a text-editor; every computer comes with one. On PCs, look for the Notepad; if you have a Mac, look for something called TextEdit. I really enjoy writing on those text-editors, they are very easy to use.

John: Can you tell me about the rules that I need to follow to work with HTML?

Amy: Of course. When you start creating a web page, you must use tags. Tags are words or letters inside angled brackets that tell the system what to do. You can find those brackets on any keyboard between the shift key and letter Z.

John: Nice! Please, keep on telling me about the rules to work with HTML.

Amy: Well, HTML is not case sensitive. You can use lowercase or uppercase to write the same codes. I suggest choosing only one in order to have consistency. You must also learn to identify container and empty tags. Container tags wrap texts between an opening and a closing tag which needs to have a forward slash to tell the browser the tag ended. And, Empty tags can stand alone.

John: Can you give me some examples of the different types of tags?

Amy: Sure. If you want the browser to display a horizontal line, you should write inside the angled brackets the letters hr. Now, a text between a tag that contains the word strong and another tag that contains a forward slash plus the word strong, makes the text bold. And the most common example of an empty tag is the line break, you just need to put the letters br inside the angle brackets.

Let's Practice!

Examples of Tags in HTML.

Instructions: Select the correct answer.

1. To use tags, you _____ a word inside angled brackets.
 - a. must write
 - b. must writes
 - c. must to write
 - d. must writing
2. You _____ the format of a text by using container tags.
 - a. can made
 - b. can writes
 - c. can change
 - d. can to change
3. You _____ to write tags in uppercase or lowercase, not both.
 - a. must chose
 - b. can chosen
 - c. shouldn't choosing
 - d. should choose

Let's Practice!

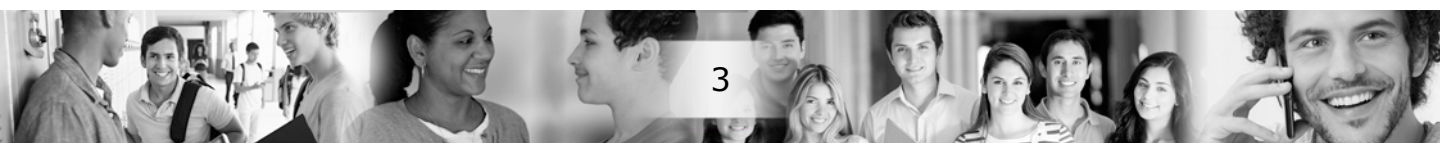

Rules for HTML.

Instructions: Organize the mystery sentences. Put the words in the correct order.

1. work / HTML. / must / You / with / use / tags / to

2. Can / rules / of / tell / you / the / about / me / HTML

3. He / text-editor. / should / use / a

Extension Activity

Let's learn about HTML.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Make a poster describing the basic concepts and rules of HTML.
- Remember to use the modal verbs and statements with verbs ending in ing.
- Share your work with your classmates and check your pronunciation with your instructor.

Self-Assessment

Yes

No

- I make a poster describing the basic concepts and rules of HTML.
- I use modal verbs and statements with verbs ending in ing.
- I share my work with the class.

☐ ☐☐ ☐☐ ☐

Target Words

- plain text** (noun): text without a graphical representation
e.g. You must write HTML in plain text and there is no need to use a fancy software to write codes.
- fancy** (adjective): sophisticated
e.g. You must write HTML in plain text and there is no need to use a fancy software to write codes.
- forward slash** (noun): an inclined line to separate letters and numbers (/)
e.g. Container tags wrap texts between an opening and a closing tag which needs to have a forward slash to tell the browser the tag ended.
- wrap** (verb): to cover something
e.g. Container tags wrap texts between an opening and a closing tag which needs to have a forward slash to tell the browser the tag ended. And, Empty tags can stand alone.
- keyboard** (noun): a part of the computer with a set of keys that you can press to write
e.g. You can find those brackets on any keyboard between the shift key and letter Z.

Learning Points

Verb + Ing.

When we want to use two verbs in the same sentence, we usually put the second verb in infinitive form (with to) or as a gerund (ending in **-ing**).

You usually add **-ing** to the **second verb** in a sentence after using some specific **verbs**. Take a look at the grammatical structure:

Subject + Main Verb + **(Second Verb + Ing)** + Complement

Let's see the following chart:

Verb	Example
Suggest	<i>I suggest using the correct tags.</i>
Practice	<i>Practice creating your own web page.</i>
Enjoy	<i>She enjoys designing websites.</i>
Finish	<i>Let's finish writing the codes; then, we can see how the page looks.</i>
Keep on	<i>We keep on learning about HTML.</i>

Examples

- *I suggest choosing only one in order to have consistency.*
- *Please, keep on telling me about the rules to work with HTML.*
- *When you start creating a web page, you must use tags.*
- *I really enjoying writing on those text-editors, they are very easy to use.*

Hypertext.

A **hypertext** is an electronic document where the reader can access other documents by using hyperlinks.

The prefix **hyper** means over or beyond. You can find **hypertexts** in any computer display or electronic devices. These types of texts contain references called hyperlinks; by accessing a hyperlink the reader can see another electronic document, which may also have different hyperlinks to visit more documents. Tables, images, and other forms to present content that contain hyperlinks are also types of **hypertexts**.
